

ABSTRACT OF THE DISCLOSURE

A summary of devices which can be operated by an input apparatus is displayed on a display unit of the input apparatus. Thus, the user can easily
5 select a device to be operated through the input apparatus. Radio connection between the input apparatus and other devices that are not operated by the input apparatus is not disconnected, but the radio connection is continued in a low-power-consumption mode. Since the input apparatus and the other devices perform only minimum transmission/reception processing, power
10 consumption and the amount of communication processing can be reduced. Furthermore, since it is unnecessary to newly perform a procedure for providing radio connection when the device to be operated is changed, switching of the device can be smoothly performed.
